## **DETAILED ACTION**

### ***Reasons for Allowance***

1. The following is an examiner's statement of reasons for allowance: In response to the final office action, dated April 16, 2008, further in view of applicant's amendments filed on 07/11/08, the application has been carefully reviewed and respectfully considered.

According to applicant's remarks in view of currently amended subject matter, as discussed in page 7 and 8, applicant amended and/or re-written claims 23 and 25 in independent form, as agreed with examiner during applicants initiated interview conducted on 07/06/08. Claims 19-22 were allowed in the previous Office action. Claims 1, 11, 13 and 15, are cancelled.

Further, the argument and remarks given by applicant has been found persuasive, and the final rejection has been withdrawn. Therefore, independent claims 19, 23 and 25, have been allowed including all dependent claims depend on therefrom, for the reasons given below:

With respect to claims 19-22 ('19', i.e., independent), the prior art searched and of record neither anticipates nor suggests the claimed invention. In particular, regarding to claim 19, the prior art searched and of record neither anticipates nor suggests a system comprising: at least one sensor; an imaging surface; means for illuminating a

Art Unit: 2625

transparency medium placed on the imaging surface during an imaging operation, the illuminating to produce a transparency image, wherein the means for illuminating includes a light source positioned on a first side of the imaging surface, and wherein the at least one sensor is also positioned on the first side of the imaging surface; and means for shifting the transparency, image to a predetermined focus point of at least one sensor, wherein the means for shifting includes plural reflective surfaces to reflect light passed from the light source through the transparency medium, wherein the plural reflective surfaces are positioned on a second, opposite side of the imaging surface.

As to claims 2-10, 23 and 24 ['23' i.e., independent] are allowed for the reasons the prior art searched and of record neither anticipates nor suggests a system comprising: an imaging device having light source, at least one sensor, and an imaging surface on which a transparency medium is to be placed, wherein the light source and at least one sensor are positioned in the imaging device on a first side of the imaging surface; and a media adapter operatively associated with the imaging device, the media adapter including a first reflective surface and a second reflective surface arranged to shift light emitted by the light source to a predetermined focus point of the at least one sensor during an imaging operation, wherein the first and second reflective surfaces are positioned in the media adapter on a second, opposite side of the imaging surface, wherein the light source is to project light through the transparency medium placed on the imaging surface, and the first reflective surface is to receive light passed through the transparency medium, and the first reflective surface is to reflect light toward the second

reflective surface, and the second reflective surface is to direct light through the imaging surface to the at least one sensor.

Finally, Claims 12, 14, 16-18 and 25 ['25' i.e., independent], are also allowed for the reasons the prior art searched and of record neither anticipates nor suggests a method, comprising projecting light from a light source along a first axis onto a transparency imaging surface on which a transparency medium is positioned, wherein light that passes through the transparency medium projects a transparency image reflecting, using a first reflective surface, the transparency image along a second axis substantially perpendicular to the first axis: and reflecting, using a second reflective surface, the reflected transparency image through the transparency imaging surface to at least one sensor, wherein projecting the light from the light source comprises projecting the light from the light source that is placed in an imaging device on a first side of the transparency imaging surface, wherein the at least one sensor is also in the imaging device on the first side of the transparency imaging surface, and wherein the first and second reflective surfaces are on a second, opposite side of the transparency imaging surface.

Therefore, claims 2-10, 12, 14, 16-25, are Allowed for the reasons the claimed invention are distinct from the prior art searched and of record neither anticipates nor suggests the claimed invention alone in combination as amended.
